Install On Raspbian

Jump to bottom

starbasessd edited this page 3 days ago · 36 revisions

Before Proceeding

- Read the general Installation page first.
- These instructions apply only to an up-to-date Raspbian Stretch.
- All commands require *root*; use `sudo` before each command or become root using `sudo -i`.
- If you want to use the CSI camera module for the Raspberry PI, make sure you have enabled it in `raspi-config`.
- Installation instructions confirmed on RaspberryPiOS 20210111 Lite, on 03/03/2021
- Installation instructions confirmed on RaspberryPiOS 20210304 Full Desktop, on 05/18/2021

Instructions

1. Install `ffmpeg` and other `motion` dependencies:

```
apt-get install ffmpeg libmariadb3 libpq5 libmicrohttpd12
```

2. Install `motion`:

```
wget https://github.com/Motion-Project/motion/releases/download/release-4.2.2/pi_buster_motion_4.2.2-1_armhf.deb
dpkg -i pi_buster_motion_4.2.2-1_armhf.deb
```

   note: Raspbian Buster comes with `motion` version 4.1; it is however recommended that you install version 4.2, as indicated above

3. Install the dependencies from the repositories:

```
apt-get install python-pip python-dev libssl-dev libcurl4-openssl-dev libjpeg-dev libz-dev
```

4. Install `motioneye`, which will automatically pull Python dependencies (`tornado`, `jinja2`, `pillow` and `pycurl`):

```
pip install motioneye
```

note: If `pillow` installation fails (hangs and ends at 99%), you can install it from official repos using
`apt-get install python-pil`
and rerun
`pip install motioneye .`

5. Prepare the configuration directory:

```
mkdir -p /etc/motioneye
cp /usr/local/share/motioneye/extra/motioneye.conf.sample
/etc/motioneye/motioneye.conf
```

6. Prepare the media directory:

```
mkdir -p /var/lib/motioneye
```

7. Add an init script, configure it to run at startup and start the `motionEye` server:

```
cp /usr/local/share/motioneye/extra/motioneye.systemd-unit-local
/etc/systemd/system/motioneye.service
systemctl daemon-reload
systemctl enable motioneye
systemctl start motioneye
```

8. To upgrade to the newest version of motionEye, just issue:

```
pip install motioneye --upgrade
systemctl restart motioneye
```

Features

Screenshots

Installation

- Install On Debian
- Install On Ubuntu (19.10 or Earlier)
- Install On Ubuntu (20.04 or Newer)
- Install On Raspbian
- Install On Fedora
- Install On Arch
- Install On Other Distros
- Install In Docker
- Manual Installation

Configuration

- Configuration File
- Running Behind Nginx
- Running As Normal User
- Action Buttons
- Monitoring Commands

Troubleshooting

Report Motion Issue
